

Steps to Create IAM Users for Boto3 Script Access

- Generally, We will have multiple AWS Accounts in real-time like AWS Account for test, dev, pre-prod and prod
- Sometime we will use even multiple accounts for prod
- Here, I am creating IAM Users from two AWS Accounts (You can go with one aws account with multiple IAM Users also)
- In real-time, we typically use IAM users for employees or service accounts with the principle of least privilege to ensure security and access control
- Here, I will be creating a service account called boto3Admin from my two aws accounts with Full Admin Access
- Steps:
 - Step-1: Access the AWS Management Console for your account (initially from root)
 - Step-2: Navigate to IAM Service
 - Step-3: Create a New IAM User (Example: boto3Admin)
 - Step-4: Attach the required Permissions to the User (boto3Admin)
 - Step-5: Now Create Programmatic Access Keys and Save them
 - Step-6: Repeat same steps for another aws account also
